

Deployment Instructions & Run Steps

Step-by-Step Setup Guide for Web App Launch

1. Local Deployment Steps

Follow these shell commands to configure the libraries and boot up the Flask web application locally:

Step 1: Set up Anaconda environment

```
conda create -n credit_card_app python=3.10 -y  
conda activate credit_card_app
```

Step 2: Install dependencies

```
pip install -r requirements.txt
```

Step 3: Run Flask Server

```
python app.py
```

Once started, access the dashboard at <http://127.0.0.1:5000/> in your web browser.

2. Server Deployment Option (Render/Gunicorn)

To deploy the web app to a cloud platform like Render or Heroku, configure Gunicorn as the production WSGI server. Build steps require setting the startup command to:

```
gunicorn app:app
```
